COMMUNITY STARTER KIT v1.1

F1 Clash AI Racing Engineer

Turn **ChatGPT** - or another capable AI assistant - into a personalized race strategist using **your actual Drivers, Components, Boosts, event screenshots, tyre information, and results.**

Recommended platform: ChatGPT. This workflow was developed and tested primarily with ChatGPT Projects. The core method is platform-neutral and can also be used with Claude, Gemini, Grok, or another capable multimodal AI.

Created by CheekyPaulie / Slipstream Boys

Version 1.1 - 2 October 2026

1. Set up your AI workspace

ChatGPT - recommended

1. Create a dedicated **Project** called `F1 Clash AI Racing Engineer`.
2. Add `MASTER_AI_PROMPT.txt` to the Project instructions or project files.
3. Upload `INVENTORY_TEMPLATE.xlsx`.
4. Upload your Driver, Component and Boost screenshots.
5. Ask ChatGPT to build/populate your inventory from the screenshots.
6. Keep future F1 Clash race chats inside that Project.

Claude / Gemini / Grok / other assistants

Use the closest equivalent to a persistent Project, workspace, Gem, custom assistant, or dedicated conversation. Add the same master prompt, inventory workbook, and screenshots.

> **ZIP warning:** attaching a ZIP does not prove the AI inspected every image inside it. If the platform cannot enumerate and read individual archive members, extract and upload the relevant screenshots instead.

What makes the system reliable

Screenshots = evidence They prove what you own and what the game displays.	**Workbook = fast lookup** It makes comparisons much faster once screenshots are transcribed.
Newest item update wins A newer screenshot changes only that matching item.	**No guessing** If a stat, quantity, rule, or icon cannot be verified, the AI must say so.

2. Capture your inventory

Category	Capture
Drivers	Name, variant/rarity, level, Overtaking, Defending, Qualifying, Race Start, Tyre Management, and any other displayed numeric fields.
Components	Name/category, rarity, level, Speed, Cornering, Power Unit, Qualifying, Overtake Mode/Battery, Pit Time, and any other displayed numeric fields.
Boosts	Boost name, quantity owned, every displayed bonus, and any special Boost Mode fields.

Do not merge these concepts: Power Unit, Boost Mode Impact, Boost Recharge Rate, and Boost Mode Duration are separate attributes.

Recommended file naming

```
Drivers_YYYY-MM-DD.zip
Components_YYYY-MM-DD.zip
Boosts_YYYY-MM-DD.zip
Driver_Update_NAME_YYYY-MM-DD.png
Component_Update_NAME_YYYY-MM-DD.png
Boost_Update_NAME_YYYY-MM-DD.png
```

Build your catalog

```
Build my F1 Clash inventory using the attached screenshots and INVENTORY_TEMPLATE.xlsx. Inspect every relevant screenshot you can actually access. Do not guess unreadable values. Record source filenames/dates and flag anything uncertain. A newer screenshot for one item updates only that item.
```

3. Run the five-question self-test

Question	Correct behavior
What proves what I own?	Your newest verified screenshots/catalogs - not generic internet stats.
One Boost quantity changed. Does every Boost change?	No. Only that Boost is updated.
Can you say a ZIP was reviewed just because it is attached?	No. Relevant archive members must actually be inspected, or the AI must say it could not inspect them.
Does a temporary +10% GP bonus become permanent?	No. Baseline and event-adjusted values stay separate.
What if one stat is unreadable?	Flag/request the missing evidence. Never guess.

If the AI fails these tests, fix the setup before trusting it for an important Grand Prix.

4. Race day workflow

Upload the race/event screenshot and use the matching prompt from `RACE_AND_UPDATE_PROMPTS.md`.

For a full race recommendation, expect:

- **Two eligible Drivers** based on your actual cards.
- **Exact Component setup or changes**, with important trade-offs.
- **NEED TO WIN Boost** for Driver 1 and Driver 2.
- **ECONOMY Boost** for Driver 1 and Driver 2.
- **Starting tyres, pit laps, replacement tyres, and contingencies.**
- **Key risks** plus anything the AI could not verify.

> **Grand Prix objective:** maximize total points / finishing positions from both Drivers - not merely beat the opponent.

After every Grand Prix result

The AI should ask only:

```
Boost used? A / B / C
```

A = NEED TO WIN plan **B** = ECONOMY plan **C** = your own Boosts

If you choose C, it should ask for the Boost used by each Driver. This lets the system learn from what you actually ran instead of assuming the recommended plan was followed.

5. Keep it current and keep it private

- When one Driver, Component or Boost changes, update **only that item**.
- Keep original screenshots as historical evidence.
- Use current official Hutch information when game mechanics, patch notes, track behavior, or event rules may have changed.
- Treat community posts as useful secondary evidence, not a replacement for official changes or your own account screenshots.
- Do not upload several clan members' live inventories into one shared AI knowledge base.

Public GitHub repo: blank toolkit only. **Your personal inventory:** keep it in your own AI workspace unless you intentionally want it public.

The six-file kit

`README.md`	Project overview
`START_HERE.md`	Setup + screenshots + self-test
`MASTER_AI_PROMPT.txt`	Full strategy and verification rules
`INVENTORY_TEMPLATE.xlsx`	Blank personal catalog
`QUICK_START_GUIDE.pdf`	This visual guide
`RACE_AND_UPDATE_PROMPTS.md`	Race, update, patch, and result prompts
